

Delivery—KFC Know-How

What You Will Need to operate Delivery

Required:	Highly recommend:	Optional:
• Phone system for access to ordering	Online & Mobile Ordering	
Call Center	\Box Call Centre (direct or online support)	
• Direct to restaurant	Market Mapping	
• Delivery dispatch area in the restaurant	□ Geo Planning	
Telephone	□ Company owned motorcycles	
♦ POS System	□ 70% bike—30% car	
• Dipstach order racking		
• Pouch positioning	□ LSM marketing plan	
• Chiller (where chilled products availa	□ By restaurant	
ble)	□ Specific packaging	
Delivery vehicles	□ Developed for off-premise	
Company owned	Delivery Manager	
Owner driver	□ Above Store Channel Leadership	
 Cars/Motorbikes 		
Driver certification		
♦ KFC training		
♦ Legal requirement training		
Hot Hold equipment		
Pouches		
Trade Zone MapPing		
 Linked POS to KDS 		
• LSM leaflets and menus		
• Full operational training program		

Delivery—KFC Know-How

Version I (August 2014)

Off-premise delivery has the potential to deliver a billion transactions a year across KFC!

Introduction

Restaurant food delivery is a huge market and a growing one. Our sister company Pizza Hut has been using this channel for many years and has developed some great expertise. KFC has also offered delivery in many different markets, with some great know-how and expertise, however, this has usually grown in isolation and without a global standardized approach. Having said that, delivery is worth over \$1billion per annum to Yum! today and is some countries, represents 50% of all business! It has huge growth potential and is becoming the expected norm for much of the territories we operate in.

This "executive summary" on delivery aims to help the understanding of the fundamentals of setting up and operating a channel that offers our customers the opportunity, via the phone or an on-line ordering platform, the chance to enjoy KFC in their home, place of work or any venue off the premises of our restaurants. After the customer places their order, the food is transported by KFC to their requested venue.. There are different types of "off-premise" channels, this introduction deals with probably the most familiar one. That of frequent, standard transaction orders delivered by bike or car to a customer from a "standard" KFC restaurant. Most of us will be familiar with this set up from our experiences of ordering Pizza Hut delivery. There is a separate supporting guide for off-premise catering.

For KFC, our mission is to develop a dominant brand that stands for one global identity. In other words, the winning formula is one global brand, competing locally. The know-how in this and the associated documents, aims to support that goal of codifying key elements around KFC delivery with the flexibility of local markets to determine the best strategic application of the channel.

All the detail regarding the implementation of this channel is contained with this website—www.KFCDAC.com In this overview we will introduce some key areas and give an overview of the delivery channel:

Why Delivery? How will I take the order? Who will deliver? How do I build delivery sales? How do I get profits? Where will I deliver? How do I deliver? How do I get the store ready? What will I deliver? How do I drive performance?

Why delivery? - The customer is always Why!

Understanding your markets needs and therefore your customers needs is where it all starts.

Developing a consumer proposition that works for your customers is key.

The tenets of ensuring competitive value, high quality, modernity and relevance will always be there.

The stronger the insights and locally relevant propositon, the higher the return.

- The global QSR delivery market is huge at well in excess of \$10 billion.
- Where KFC offers a relevant consumer proipistion to the consumer and delivers against its promise, it can be a significant sales and profit generator
- Delivery customers can be the most frequent and the most loyal of all our customers, giving us hug brand sponsoirhsip when we get it right
- Delivery can ensure maximum return in underperforming assets.

And the customers loves KFC Delivery!

• Delivery customers tend to order more frequently than dine-in customers and spend more! (MenaPak data 2013)

- Average delivery transaction = \$12 vs Average dine in transaction at \$5
- Delivery represents 50% of trade in some markets
- Frequency of delivery pushes up average frequency 4 of top 10 frequency countries are in Mena with market mix of 35% delivery and 3-4% catering mix
- Global spend on QSR delivery tops \$10 billion!
- At 3% of mix delivery and catering could equate to +\$1000 wpsa or +\$50k per annum X 20000 KFCs = \$1 Billion
- Unlocking potential....delivery and catering go where restaurants can't!

• Catering Customer is a valuable customer (US data 2013)

Current KFC Customer	KFC Catering Customer		
Orders 6 times per year, buys a 2 pc box meal	Orders 3 times per year, buys a meal for 15 people		
\$6 per order	\$80 per order		
X 6 orders per year	X 3 orders per year		

\$36 annual spend

\$240 annual spend

Market Mapping

The ideal starting place for opening up a home delivery business is to understand the end goal of what will penetration look like and what is your plan to get there. Through various methods of market mapping including Yums! global relationship with GeoMap, markets are now able to fully understand the level of restaurants they can get to and through that what is the short, medium and long-term plan for delivery stores. Regardless of how sophisticated your market mapping is, the temptation to have huge delivery areas until you open more stores is always there. Regardless of the number of restaurants, you should stick to the guidelines of trade zoning and the delivery standards to ensure that its right for the customer and the brand. Within the detail of the know-how portal, you are able to see the ideal number of household, demographic advice and so-on, but 1 restaurant should not try and deliver to a whole city!! This exercise should be led at a senior and central level as it will determine not only delivery expansion, but also all non-delivery opportunities

Trade Zones

At an operational, area and store level, the detailing of a trade zone should be handled by the AC and the RGM. This involves thoroughly understanding the competitive landscape, key business drivers as well as household counts, drive times and natural boundaries. This Trade zone mapping should be reviewed regularly as towns shrink and expand and especially when new KFC restaurants open.

Podding and Hot Zones

Once a trade zone is established, the RGM and AC should develop pods. These are smaller, more logical jigsaw pieces of the trade zone, which will help on a number of fronts;

- You can identify and use natural boundaries, roads, rivers, tunnels, one way streets
- You can section areas in to manageable, smaller areas for individual drivers
- The dispatcher is able to facilitate faster delivery by allocating using pods close to each other or with easier access

Mapping, zoning and podding

- Market Mapping should be centrally led
- Trade zones and podding should be led by operations

How do I get profits?

Financials

There are two key elements addressed within the financial summary

- I. The capital expenditure
- 2. The ongoi8ng P&L impact

These are financial guides and indicators which may vary from market to market, so significant thought, sense testing and rigor should be applied to both elements during the forecasting and planning of delivery as a channel. The aim is to give a structure to these considerations rather than apply a definitive \$ figure to costs.

Capital Outlay

Additional cost associated with delivery

- In restaurant
 - Additional POS
 - Additional phone line/s (without call center)
 - Hot Hold Pouches and racking
 - Approx. 10sqm for dispatch area
 - Chillers/desks/maps/uniforms
- Outside restaurant
 - Vehicles
 - External Uniform and helmets
 - Legislative driver training
 - Parking or vehicle siting area
- Centrally
 - Call Centre (if unit telephonists not used)
 - LSM production (may be local)
 - Delivery management (Human Resource)
 - I.T infrastructure upgrades
 - Online and mobile interface development

How do I get profits?

P&L Ongoing Costs

Delivery is a more expensive channel to maintain that a standard in restaurant offering due to the following reasons;

I-The upkeep of vehicles (company owned) or the premium paid to owner drivers

Whether you decide to purchase vehicles and maintain them as a company asset, or employ owner drivers, the cost will be similar.

2-The upkeep of I.T infrastructure and hardware (call center/POS/teleph9ones/on-line)

How do I layout the asset and how do I operate?

- I-Dispatch area containing phone, POS, map, KPIS, printer and dispatcher
- 2- Pouch rack-containing heated pouches
- 3-Separate entrance and exit for delivery drivers
- 4—Parking/storage area for vehicles

The successful application of the delivery channel is very involved. There are significant changes to the layout, staffing, deployment and economics of a restaurant.

The full step by step detail of the operation is covered in full in the associated workshop and the operating manual for both delivery and catering. IN order to give some idea of what is needed for success, we will cover 3 areas in this summary document.

In order to delight our customers, the expectation is to receive perfect food in the promised time of 30 minutes. Here is we achieve 30 minutes;

- Talk time 2 minutes
- Pack time 4 minutes—pouch time 1 minute—Speed rack time (wait) 2 minutes = in-store 7 minutes
- Maximum drive time 8 minutes
- Total for I order 17 minutes
- +2 minutes door courtesy + 5 minutes to second delivery
- Total for 2 order is 24 minutes
- Maximum delivery is 2 orders

Operations and KPIs

The complications that a new channel can bring to your operation should not be underestimated and this know-how portal gives all the tools necessary to run a World Class operation, whether you are starting out or just looking to enhance an existing business.

- Full operational workshop and toolkit. This support from the ASL to the RGMs
- There is a full training suite that supports the restaurant teams and the team members
- All standards are codified and suggested operating methods as well as best practice KPIs are shared and demonstrated.

Learnings point to the benefit of having delivery know-how in your market and having an owner of the channel to lead the operational standards and galvanize the business is a huge benefit

The many standards, measurements and intricacies of operations are talked through in detail throughout the know-how site and in their entirety in the "Bringing it All Together " section.

The measurement of the stores performance above and beyond the financial elements should be

based on the customer interface method and the restaurant itself.

Customer interface is a call center, online portal or in-store telephonists.

You should look to measure the performance for the customer as well as the throughput and productivity.

2)- Restaurant KPIs

should reflect the individual (and roll-up) performance against the standards and also the throughput and productivity of transactions..

(3) Deployment and staffing

The correct amount of staffing is vital to the success of delivery. Markets find very heavy peaks occur and to ensure the safety of the drivers, the speed and consistency of the delivered product, all efforts in to accurate forecasting and appropriate manpower should be made. Delivery is a more expensive (in terms of %) channel than dine-in. From a labor perspective, this is due to the need for very specific roles to be carried out, with little or no sliding and the time the presentation of an order takes (the actual delivery) and the effect that has on productivity. As a rough estimate a dine-in order will cost approx. \$1.50 in labor to produce, a delivery order can cost \$4.00. However, the incremental sales are worth it, as the loyalty and frequency of the customer is significantly more than that of those who visit the restaurant.

Some guidelines on delivery manpower needs are shown here. Please refer to the manual and workshop for further details.

• You will need one telephonists for every 25 calls per hour. Example: 70 Orders = 70/25 = 2.8 = 3 telephonists

For call center operations, the entire business needs will be calculated

- Online ordering will of course drastically decrease the number of call center operatives you require.
- A dispatcher can handle up to 50 orders per hour. Example 70 orders = 70/50 = 1.4 = 2 dispatchers

Where calls are handled in the restaurant, dispatcher and telephonists can slide

• Drivers should work to 4 orders per hour/ Example: 70 orders = 70/4 = 17.5 = 18 drivers

Drivers should only deliver up to 2 orders at one time in order to hit <30 minutes. Average is 1.3-1.4

As you can see. For 70 delivery orders in one hour, you need 23 TMs which equates to a productivity level of just over 3 trans per labor hour. This is normal for the delivery channel. For catering, the productivity is stronger.

(4) Standards and Measurements

KFC is built upon great tasting, fresh products. Protecting this in a delivery channel is key. Below is an example of a delivery dashboard which demonstrates some of the key measurements. With the advent of Guest Experience Surveys, we have even more opportunity to add satisfaction Reponses to this type of dashboard. Such as speed, temperature and product quality.

Markets use various measurements, but consistent are these;

- Delivered within promised time (should be 30 minutes)
- % of calls answered within 3 rings
- Abandoned at less than 2%

Delivery Pre-Launch

1st—The Customers

Then.....

Task	Responsibility	Target Date
3 Months Before Launching Delivery		
Identify Delivery Area, produce map with border		
Determine BOH Layout and plan amendments if needed		
Order Bags & PDU		
Order Bag Racks		
Order Phone lines with line hunting facility		
Order PABX + Phone Terminals		
2 ¹ / ₂ Months Before Launching Delivery		
Get Appendix for Franchise Agreement in place		
Start driver recruitment process		
Staff accident insurance need to be in place including 3rd Party insurance		
Manager Training (Delivery in DC Modules)		
Develop LSM Plan + Materials		
Order order-taker Terminals		
Order Dispatcher Terminal with Printer & Cash Drawer		
2 Months Before launching Delivery		
Order delivery vehicles as needed		
If Bikes used get helmets, kit, gloves, boxes		
Vehicle maintenance contract		
Get LSM Plan Approved		
6 Weeks Before Launching Delivery		
Order driver uniforms		
1 Month Before Launching Delivery		
Mapping with Pods to be completed		
Driver Training		
Order Taker Training		
Dispatcher Training		
Install Bags and Racks and Test		
Load addresses into IT system with grids		
Installation and cabling for terminals and printers		
2 Weeks Before Launching Delivery		
Start LSM Teaser Campaign		
Post Delivery Targets Board		
Update sales forecast to include delivery		
Map with pods posted in delivery area		
Provide podded map to drivers		
Trade area familiarisation with drivers, order takers and dispatcher		
Drivers equipped with emergency contact numbers		
Roster for drivers and call takers posted		
Confirm Sales Reporting		
Test Phone system		
Test POS system		
Soft Launch		
7 Days Before Launching Delivery		
Generate and evaluate operations reports from POS		
Ensure phone script and menu at all order taking points		
Launch Date		
Kick off LSM with menu drops
